Instructions to use

- This Vibe Coding Handbook covers the basics of vibe coding with Google's AI tools e.g. AI Studio & Antigravity.
- It can be used by anyone to learn themselves or to share with their community at events or demos.
- Always make sure to use the latest version of the deck as it is being updated on a weekly basis.
- Please share the shortlink while presenting so your audience can access or make a copy (**https://goo.gle/itsvibecoding**)

Google for Developers

Vibe Coding with Google AI

Zero to One

Build your first app with Google AI Studio & Antigravity

Get free access to this handbook

goo.gle/itsvibecoding

Updated 11 Apr 2026 | Make a Copy

What is Vibe Coding?

This term was coined by Andrej Karpathy in 2025

- Vibe Coding is a simple approach to build apps using natural language.
- You give instructions in simple language “Hey! build me an xx app that does yy” to an agentic platform and it builds the app for you.
- In most cases you can go from a simple idea to a live app preview in ideally less than 15 mins.
- **No programming or coding experience required.**

Who should use this?

This handbook is for **Developers & Builders** who want **Superpowers!**

- **Developers**: who already have the technical background and are ready for accelerated implementation with AI and Cloud technologies.
- **Builders**: who have limited experience with coding, like Product Managers, Designers, Business Consultants, etc, with a real-world problem to solve.

You can use this handbook to create interactive meetings, run a hackathon or even teach people in your network how to vibe code with Google AI!

Why “Vibe Coding” is for you

THE TRADITIONAL WAY

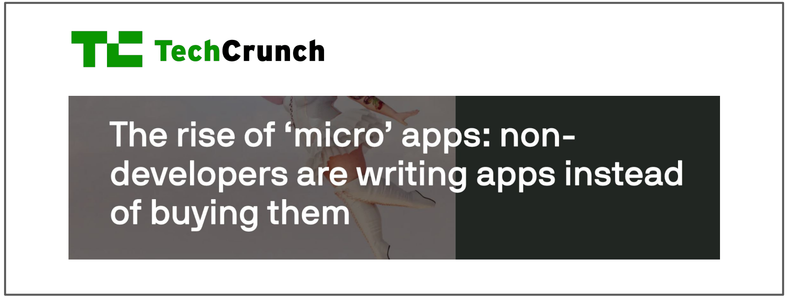
- Learning complex syntax and languages
- Months of development of a prototype
- Getting stuck on a single bug or error.

THE VIBE CODING WAY

- Describing your idea in plain English.
- Building fully functional apps in minutes.
- Clicking "Fix" and letting the AI self-heal the code.

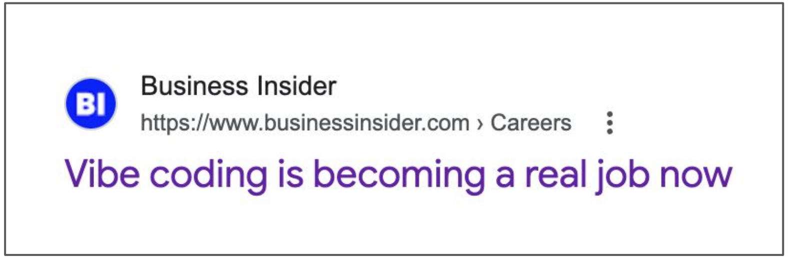
This is arguably the best time in history to learn how to build.

People are building their own apps with vibe coding to showcase their craft & creativity and to bring new ideas to life.



TechCrunch

The rise of ‘micro’ apps: non-developers are writing apps instead of buying them



Business Insider

Vibe coding is becoming a real job now

Google offers the full-stack for vibe coding. Follow 3 simple steps to take your app live

Step 1: Think

Think (The Intent)

Define the core problem you want to solve. Whether it's a productivity utility or a retro game, focus on the intent you'll describe to the AI

Step 2: Build

Build (The Vibe)

Use AI Studio for instant prototypes or Antigravity for agentic coding. Describe your idea and watch the agent build the logic and UI in real-time

Step 3: Publish

Publish (The Launch)

Deploy your app instantly to Google Cloud. Go from a local preview to a public URL that you can share with your team, users, or the world

Stitch Gemini

AI Studio Antigravity

Google Cloud Run

Google’s vibe coding tools & platforms

AI Studio: Rapid Prototyping

For **Builders & Curious Creators** who want to describe or draw an app and get a functional UI with **live preview** instantly.

Antigravity: Agentic IDE

For **Adv Builders and Developers** who are comfortable in an IDE environment but want an **AI "partner"** to do the heavy lifting.

Gemini CLI: Smart Terminal

For **Terminal Purists and Developers** who prefer text-based, high-speed workflow for rapid iteration and **system-level tasks**.

Finding your entry point in vibe coding

Tool	Starting Point	Skill Level	Coding approach	Key feature
Google AI Studio	An idea you want to see, fast	Beginner. No coding experience needed	No code / Low Code	Single-prompt app generation with zero friction deployment
Google Antigravity	An engineering task or mission	Beginner to advanced	Agent-first / Autonomous	Mission Control for orchestrating autonomous agents across the editor, terminal, and browser.
Gemini CLI	Terminal based development	Intermediate to advanced	Terminal first / AI-assisted	Open-source agent for terminal-first "vibe" workflows

The Vibe Coder's Glossary

VIBE CODING

Shifting from writing manual syntax to **orchestrating intent**. You provide the "vibe" (the goal and style), and the AI handles the implementation.

AGENTIC AI

AI models that don't just "chat," but can **take action**—browsing the web, running terminal commands, and editing files autonomously.

TOKENS & QUOTA

The basic units of information the AI processes. Think of them as the "fuel" consumed during a build or a complex planning task.

MODEL CONTEXT PROTOCOL

The "**universal connector**" that allows your AI agents to securely see and use your local files, Google Drive, or GitHub repositories.

CONTEXT WINDOW

The AI's "active memory." A larger context window (like Gemini's 2M tokens) allows the agent to remember your entire project history.

ARTIFACTS

The specific outputs created by the AI, such as a code file, a diagram, or a live preview window

Step 1: Think

Bring your big idea to life with help of simple prompting techniques.

Building simple apps with vibe coding

Retro Arcade Games

Interactive Dashboards

Productivity Utilities

Personal Portfolios

Custom Media Players

Smart Calculators

Interactive Storyboards

Resource Libraries

Event Countdowners

Daily Habit Logs

AI features you can integrate in your app

Nano Banana Powered app

Add powerful photo editing to your app. Allow users to add objectives, remove backgrounds or change a photo's style just by typing.

Analyze images

Enable your app to see and understand images. Allow users to upload a photo of a receipt, a menu or a chart to get instant data extraction, translation or summary.

Generate Speech

Give your app a voice. Add text-to-speech to read articles aloud, provide audio navigation, or create voice-based assistants for your users.

Gemini intelligence

Embed Gemini in your app to complete all sorts of tasks - analyze content, make edits and more.

Transcribe audio

Add a feature to provide live, real-time transcription of any audio feed for your users.

Fast AI responses

Add lightning-fast real time responses to your app using Flash Lite. Perfect for instant auto completes, or conversations agents that feel alive,

Use Google Search data

Connect your app to real-time Google Search results. Build an agent that can discuss current events, cite recent news or fact check information.

Prompt based video generation

Add video generation to your creative app. Let users turn their blog posts, scripts, or product descriptions into short video clips.

AI powered chatbot

Add a context-aware chatbot to your app. Give your users a support agent that remembers the conversation, perfect for multi-step booking and troubleshooting.

Use Google Maps data

Connect your app to real-time Google Maps data. Build an agent that can pull information about places, routes and directions.

The anatomy of a "Powerful" prompt

Expand your prompt into multiple layers

[Give a role]
[Define the goal]
[Provide context]
[Does it need AI?]
[Create the vibe]
Optional : [Add a visual]

Good prompt

INSTEAD OF THIS

Help me build an app to track my food and water intake.

Powerful prompt

TRY THIS

You're an app builder who prioritizes good user experience. Create a web app that helps me track my food calories and water intake. I plan to use this app daily to count my calories and track my water intake and I want weekly summary. It would be good to use AI to track my calories if I can provide pictures of my food. Create a skeuomorphic vibe. Use the attached mockup for inspiration.

Advanced prompting techniques

Iterate with Action History

Don't just look at the result; review the Action History to see exactly which files Gemini edited. If a specific logic or style is off, use the Live Preview to test the change instantly and ask for a targeted fix

The Layered Build Approach

Build your app in cycles rather than all at once. Start with the core functionality (the "logic"), then layer on the Aesthetic UI , and finally integrate your chosen AI Features like Nano Banana or Google Maps data

The Architect Interview

Before starting a complex project, ask Gemini: "I want to build [App Name]. Ask me 5 technical questions about my user flow and tech stack before you start coding". This ensures the Built result matches your vision perfectly

Blueprint Optimization

Ask Gemini to *"Rewrite my prompt into a professional technical specification"* before you run it. This helps ensure the code it generates is modular and follows best practices

Step 2: Build

Build your big idea with help of prompt-to-prototype tools & platforms

Shifting to an era of action

UNDERSTANDING
Gemini 1

THINKING
Gemini 2

ACTION

Models like Gemini 3.0 have set the stage for vibe coding by going from mere understanding and thinking to agentic reasoning. This “agentic reasoning” capability allows vibe coding platforms to think, build and publish.

Jump to AI Studio

Jump to Antigravity

Getting started with AI Studio

Browser-Based & Accessible

Works across desktop and mobile. Sign in with your Gmail account to begin instantly.

Community Gallery

Browse massive community collections to see what's possible and find inspiration.

Prompt-to-Prototype

Start with high-value prompts to avoid "analysis paralysis." Layer on complexity later.

Visual Intelligence

Upload mockups or sketches; AI Studio converts visual inspirations into functional code.

Free Credits Available

Contact your Google for Developers PIC for free credits to build and publish apps without a credit card.

Choose your path: Playground vs Build

AI Studio offers two distinct workflows tailored to your development stage and technical needs.

Testing & Logic

Playground Mode

CORE INTENT
Testing prompts and exploring model capabilities.

PRIMARY OUTPUT
Text, images, or code snippets to be copied.

BEST FOR
"Technical Purists" or developers designing specific logic.

CONTROL LEVEL
High. Manual tuning of Temperature & Instructions.

Creation & App Prep

Build Mode

CORE INTENT
Moving from a simple idea to a live app preview.

PRIMARY OUTPUT
A fully functional, multi-file React web app.

BEST FOR
"Builders" (PMs, Designers) solving real-world problems.

CONTROL LEVEL
Low friction. AI manages the technical complexity.

Go to ai.studio/build to build your app

Open ai.studio/build and write the following prompt

Build a React web app that is a Space Invaders game and a Music Player combined. Use Tailwind CSS with an 80s vaporwave aesthetic (purples, pinks, and scanlines). I want to play the game in the center window while synth-wave music plays in the background. Add 3 dummy tracks, controls for the music (play/pause/skip), and a high-score counter for the game.

src/components/MusicPlayer.tsx
src/components/SpaceInvaders.tsx
src/App.tsx
Built
I've built **SynthInvaders**, a retro-futuristic fusion of a classic Space Invaders arcade game and a synth-wave music player, all wrapped in a vibrant 80s vaporwave aesthetic.
Key Features:
• **Vaporwave Arcade**: A fully functional Space Invaders game built on a custom <canvas> engine. It features glowing neon entities, multiple waves of enemies, and a persistent high-score system.
• **Synth-wave Radio**: An integrated music player with three dummy tracks. It includes functional play/pause, skip controls, a visualizer effect, and track metadata.
• **Aesthetic UI**:
AI Features
Add enemy types
Add power-ups
Make changes, add new features, ask for anything

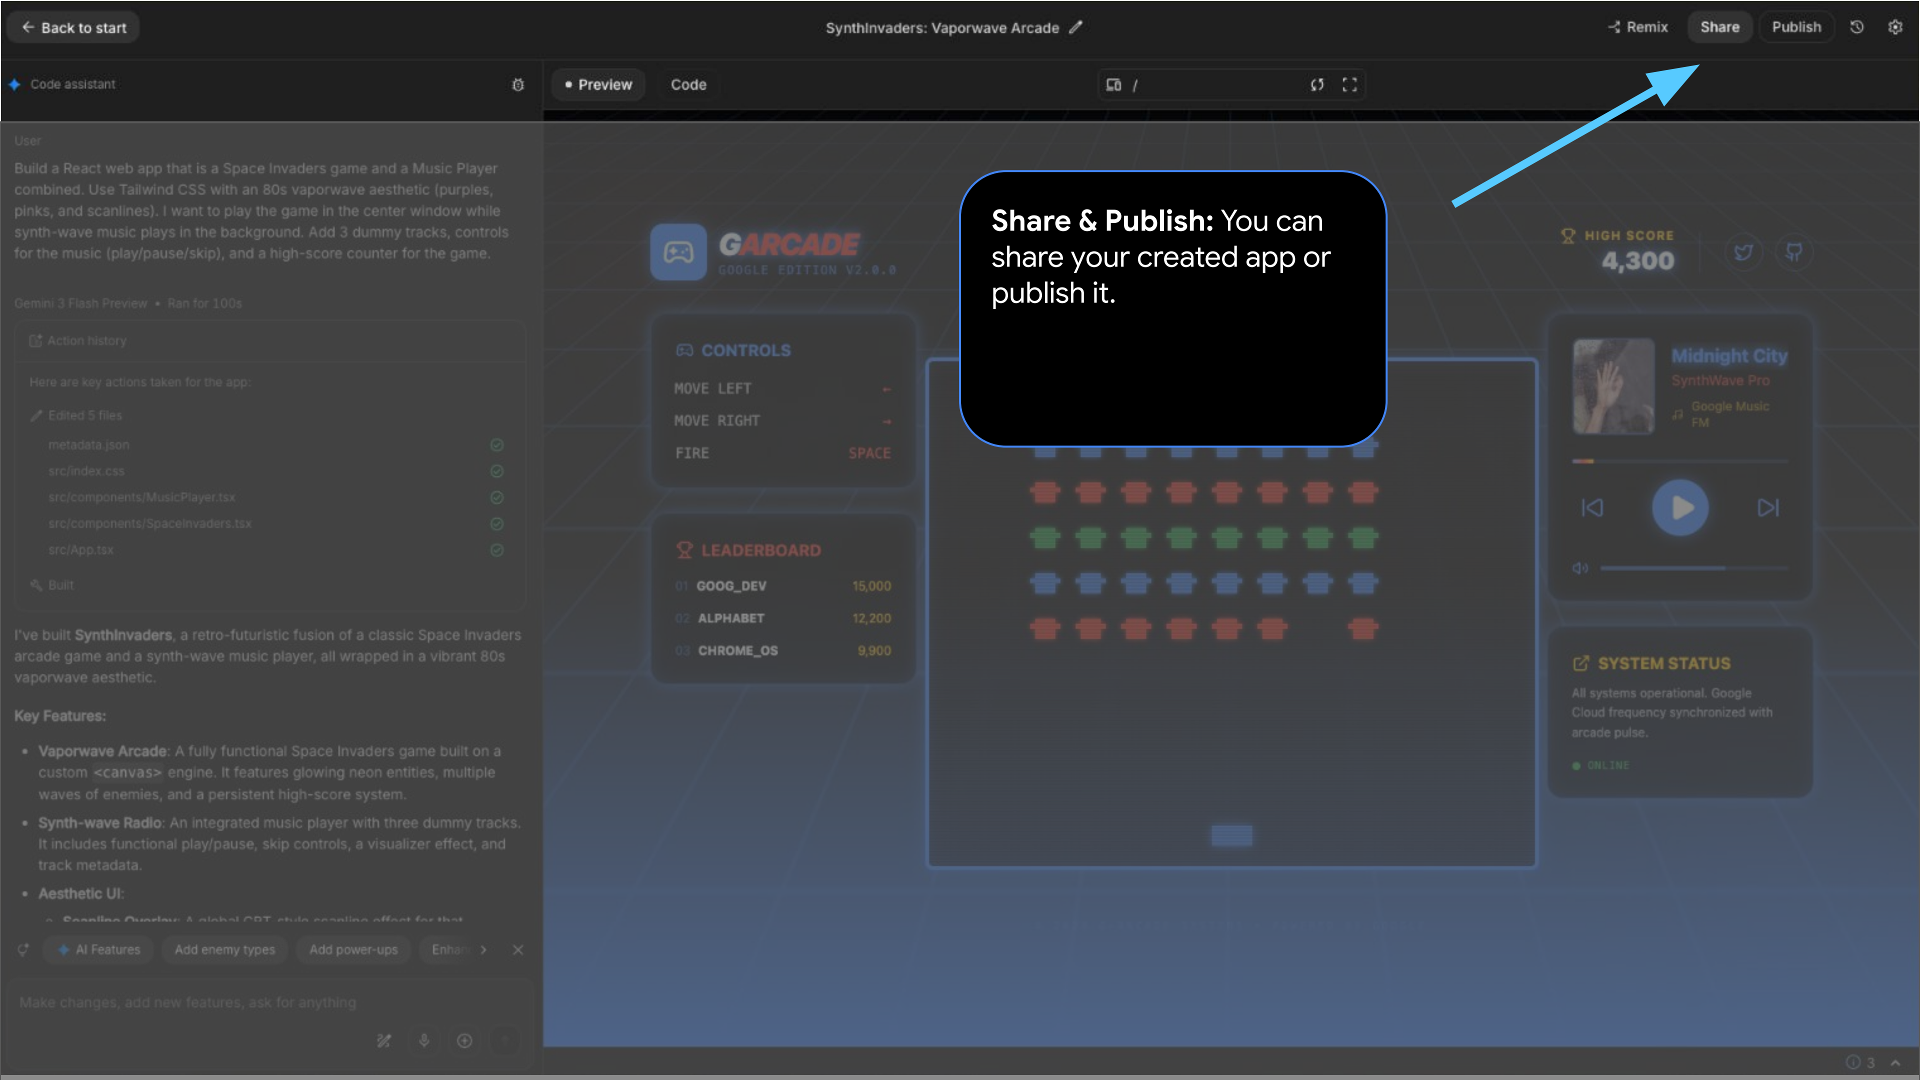
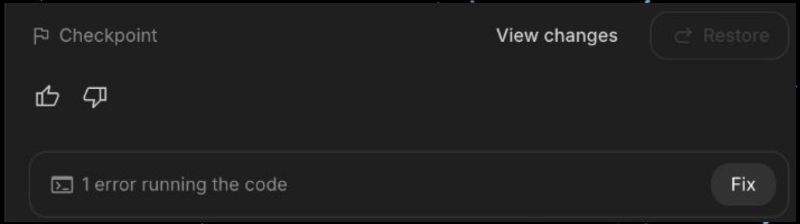
Annotation: Clicking "Annotate app" button will open the annotation toolbar which lets you edit your app with visual instructions.
Add to chat



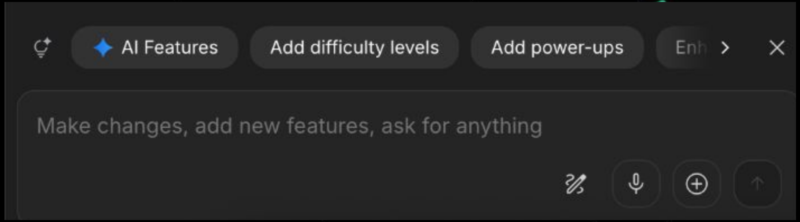
Share & Publish: You can share your created app or publish it.

Mastering key features

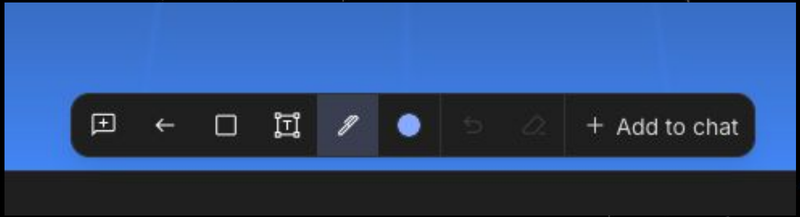
Fix Errors with AI
Don’t let bugs slow you down. If you encounter an error, simply click "Fix" to let Gemini’s self-healing engine automatically diagnose and repair the code.



Annotate, Speak, or Upload
Enhance your app using visual annotations, voice commands, or file uploads. This provides the agent with deeper context to refine your UI or logic exactly as you envision it.

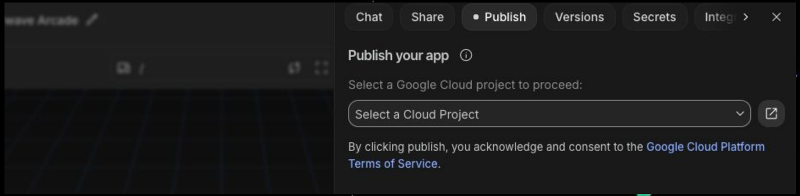


Mark/Chat to Enhance
Use the annotation bar to write comments, mark areas or pin-points segments of your app which need to be edited and then use “Add to chat” to instruct the agent.

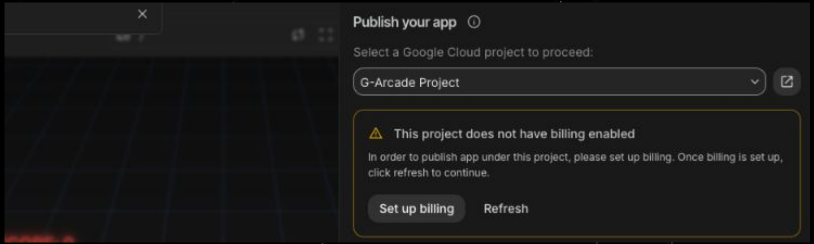


Launching your app

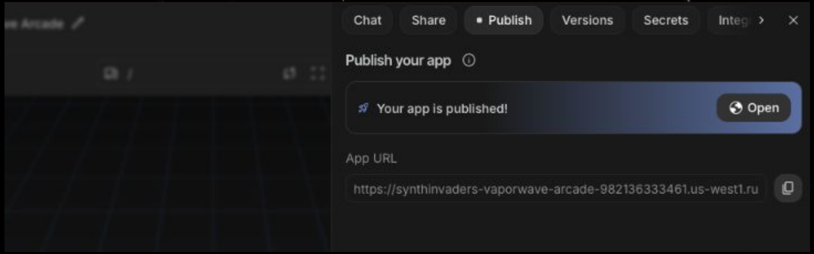
Publish your app
Select a Google Cloud Project from the drop-down and select "Create Project" and give it a name.



Set up Billing
In the next step it will ask you to connect your billing account. Click on "Set up billing" and select the billing account with the credits.



Your app is published
In the next step you will see your app is published and the App URL will be available to you.



Getting started with Google Antigravity

Antigravity is an agent-first tool. Its locally downloadable tool that allows high-speed workflows and deep access to your project files.

Switching between tools comes down to your preference: Use AI Studio for visual live previews, and move to Antigravity when you are ready for system-level implementation.

Switch from a single-prompt interface to a "Mission Control" where you can orchestrate autonomous agents across your editor, terminal, and browser simultaneously.

Antigravity

If you haven't already, please **install Antigravity** to follow along the hands-on sessions later and build wonderful projects!

antigravity.google/download

Scan here for vibe coding tips!

Build your first app in Agent Manager

Open Antigravity and enter your first app prompt

You're an app builder who prioritizes good user experience. Create a web app that helps me track my food calories and water intake. I plan to use this app daily to count my calories and track my water intake and I want weekly summary. It would be good to use AI to track my calories if I can provide pictures of my food. Create a skeuomorphic vibe.

Implementation Plan: NutriLog
NutriLog is a premium, skeuomorphic web application designed for daily health tracking. It focuses on a tactile user experience and features AI-powered food logging simulation.
Core Features
Skeuomorphic Dashboard: Custom dial for calories and a 3D glass for hydration.
AI Photo Analysis: Mock implementation of visual food recognition.
Water Tracking: One-tap buttons for common intake amounts.
Persistent Storage: Data is saved to localStorage for cross-session continuity.
Weekly Summary: Visual chart of the last 7 days of calorie and water intake.
Tech Stack
Frontend: Vanilla HTML5, CSS3, JavaScript.
Design: Neumorphic shadows, glassmorphism, and custom Google Fonts (Outfit, Playfair Display).
Icons: Emoji-based for low-latency visual cues.

Prompting techniques to keep in mind

- Define the "What" (Goal), the "How" (Constraints), and the "Success Criteria" (Definition of Done).
- Assigning a specific seniority or specialty to an agent changes its behavior and the tools it prioritizes.
- Use @filename or @directory to point the agent exactly where to look.
- After implementation, run the app and record a browser session video showing the successful login flow
- If you have proprietary logic (e.g., a custom internal API), don't explain it in every prompt. Instead, create a SKILL.md file in the .agent/skills/ directory.
- Please perform a security audit on this project specifically for API keys. Check if any keys are hardcoded in the source. If they are, refactor the code to use environment variables via a .env file. Ensure the .gitignore is properly configured to block .env and any other sensitive files from being tracked by Git.

Step 3: Publish

Deploy your app to production and share the magic with everyone.

Get Started with Cloud Credits

Request resources to deploy and share your vibe-coded apps

goo.gle/community-cloud-request

Why request credits?

Deploy and publish your apps instantly to the world. Credits cover your hosting needs.

Already have a link?

If you've received your credit link, proceed to the next step to redeem and start building.

If you renamed your trial billing account with free credits, you will see the new name here.
In this row you will see value of the credits, including start date and end-date and % remaining.

Using Cloud Credits for Vibe Coding

Vibe Coding on AI Studio

Your AI Studio model quota is linked to free tier (unless you have purchased more quota). The cloud credits provided cannot be used for model usage however you can use the cloud credits to deploy your vibe-coded app to Cloud Run for free.

Follow the guide

Vibe Coding on Antigravity

Antigravity is free and your Antigravity model quota is linked to your Google AI subscription. However, you can use the cloud credits provided to deploy your app to Google Cloud Run via the instructions provided.

Follow the guide

Vibe Coding on Gemini CLI

Free tier users can use flash models in Gemini CLI. You can follow either of these options to unleash pro models or use cloud run. 1) user Vertex AI authentication to unleash the pro models. 2) guide them deploy the vibe-coded app to Cloud Run.

Follow the guide

Thank you!

Happy Building #BuildwithAI
